
Assignment 0: kristofferhj

Repository: MOD550, and it is public

Delivered: 04.09.2026 21:22, in time

README: there is none. Add one with your name and student mail (no points lost)

97.5/100 + 5 bonus = 102.5 A

Task 0: (requirement)

Your repository is public. The assignment asks for a private one shared with me. No points are attached, switch the setting anyway.

Task 1: (10/10 pts)

ok

Task 2: (47.5/50 pts)

In `tools.py` (15/15 pt)

ok. Suggestions: both docstrings open with an empty line and jump straight to Args, and the Returns block lists four things while the function returns one. Say what it returns, and put the rest in the description.

In `code.py` (15/15 pt)

ok. Suggestions: line 33 is `print` on its own, with no brackets. That is a reference to the function, not a call, so it prints nothing. You meant `print()`.

In `test_code.py` (15/15 pt)

ok

In `jupyterther_code.ipynb` (2.5/5 pt)

The notebook holds a single cell. The task asks for the same work spread over at least three cells, one per file, so this is half delivered. Next: `python_intro` in the course material shows the layout.

Task 3: (40/40 pts)

Folder and structure (10/10 pts)

ok

In `tools.py` (10/10 pts)

ok

In `code.py` (10/10 pts)

ok

In `test_code.py` (10/10 pts)

ok

Bonus: (+5)

- test with pytest: +5 (both folders collected and passing)
- pylint 10/10: 0 (you are at 9.07 and 8.97, close)
- use classes: 0
- numpy to generate the data: 0
- submit 1 day earlier: 0

If you are not using them already: pylint, pycodestyle and pydocstyle. Run them on your own files and fix what they report.

Overall

Everything runs, the tests are the most thorough in this batch, walking both sides of all four thresholds and the open door case, and pytest picks them up without help. Only the notebook is short of the mark.

You are at 9.07 and 8.97 on pylint, which is one good hour from 10 and 5 more points. Your folders sit inside a directory called Assignment0, which costs nothing, just keep the layout when assignment 1 arrives.

Printing the per list subtotal next to the running total, so the reader can check your arithmetic by eye, is a small thing almost nobody did.
